

Amendments to the Abstract of the Disclosure

Please replace the Abstract of the Disclosure with the new Abstract of the Disclosure set forth below:

ABSTRACT OF THE DISCLOSURE

The bread board or circuit board (90) is made of insulating material, has opposite plate surfaces and has a conductive strip portion (30) including a grouping of three rows (36, 38, and 40) of sets of at least three spaced apart connection locations on a plate surface or holes (14) through the plate. A group of at least three connection locations or holes are connected together in a line and each line is called a conductive strip (44). Beneath the holes are connector clips. All the conductive strips (44) are electrically isolated from each other and the conductive strips (44) in each row are offset from the conductive strips (44) in adjacent rows. Certain groups of connection locations or holes in three adjacent conductive strips (44) form a diamond-shaped four location connector or four pin socket (100) that has a connection location or a connector clip in each one of its corners that originates from a different conductive strip (44).
